Laravel / Events

Brainster Web Development Academy

Exercise 01

Create a new Laravel application and add authentication using any of the Laravel starter packs.

Add a migration to add 2 new columns in the users table: status and token.

The default value for the status column should be `inactive`.

The default value for the token column is random 8 characters long token.

When a new user registers, he is by default inactive. This means, after login he is taken to a page where a link like this is shown: APP_URL/register/{token}. For example: http://localhost:8000/register/H2XU7AG3

This url, serves as a referral link. The user should invite a friend by sharing this url. If someone registers using this url, an event is triggered which updates the status column for the user who referred the new lead to `active`. If user with active status signs in, he is taken to a different page. Use your imagination for the content of that page, since the user is considered premium.

Summary: All users are inactive, until they refer a friend and that friend joins the app. When the first friend joins the application, the user who referred him, is updated to premium by making his status: active.
